ABSTRACT

This report documents data obtained during a wind tunnel test of a 0.010-scale 140A/B configuration SSV Orbiter in the NASA/Langley Research Center Continuous Flow Hypersonic Tunnel. The test was conducted beginning 4 March and ending 6 March 1974 for a total of 24 occupancy hours. All test runs were conducted at a Mach number of 10.3 and at Reynolds numbers of 0.65, 1.0 and 1.33 million per foot. Only the complete 140A/B was tested with various elevon, speedbrake and bodyflap settings at angles of attack from 12 to 37 degrees at 0 and -5 degrees of beta, and from 0 to -9 degrees of beta at 20 and 30 degrees angle of attack.

The purpose of this test was to obtain hypersonic longitudinal and lateral-directional stability and control characteristics of the updated SSV configuration.

TEST FACILITY DESCRIPTION

The Mach 10 nozzle of the Langley continuous flow hypersonic tunnel is designed to operate at stagnation pressures of 15 to 150 atmospheres at temperatures up to 1960°R. Air is preheated electrically by passing through a multi-tube heater. The nozzle has a 31-inch square test section which incorporates a movable second minimum. Continuous operation is achieved by passing the air through a series of compressors. Additional information on this facility is given in NASA TM X-1130 entitled, "Characteristics of Major Active Wind Tunnels at the Langley Research Center," by William T. Schaefer, Jr.

DATA REDUCTION

The LaRC 2019 balance was used to measure Orbiter forces and moments at three Reynolds numbers. Data were converted to standard NASA force and moment coefficients and are presented about the moment reference center of $X_0 = 1076.7$, $Y_0 = 0$, $Z_0 = 375$ inches full scale. Data are presented in both stability and body axis systems.

Additionally, the normal force center of pressure is presented:

$$X_{cp}/l_B = \frac{X_{CG}}{l_B} - \frac{C_m (\bar{c}_w)}{C_N l_B}$$

where X_{cp} is the longitudinal distance from the inner mold line nose station ($X_0 = 238$ inches full scale) to the center of pressure.

The reference dimensions and constants utilized were as follows:

<u>Symbol</u>	<u>Definition</u>	<u>Value</u>
b_w	reference wing span	936.7 in
\bar{c}_w	reference MAC	474.8 in
l_B	reference body length	1290.0 in
S_w	reference wing area	2690 ft ²
X_{CG}	longitudinal length, nose to Moment Reference Center	838.7 in
XMRP	longitudinal length to Moment Reference Center	1076.7 in
YMRP	lateral length, plane of symmetry to Moment Reference Center	0 in
ZMRP	vertical length, FRP to Moment Reference Center	375.0 in

REMARKS

It was decided not to utilize the HCF 09 balance at the start of the test program due to time constraints, and consequently no data were obtained at a Reynolds number of 2.2×10^6 per foot as delineated in the pretest report. In compromise, data were obtained at a Reynolds number of 1.33×10^6 per foot, which corresponds to the maximum safe loading of the LaRC 2019 balance.

At the lower end of the scale, it was found that $RN/L = 0.65 \times 10^6$ per foot was the lowest value of the parameter where there was reasonable assurance of maintaining flow.
